

NoTimeMover Web Landing Page Design

- Simple
- Uber style simplicity
- Similar Company: <https://www.muvr.io/>
- Black and Dark Coffee Brown or Black and White

This is a moving marketplace where the customer sets the price of the move and will get matched with a mover. With that, I will handle all the backend bookings. We won't add the payment process to start. This is to test demand. How it will work is customers will put their pickup and drop off location, select the size of their home, set their budget they are looking to spend, and then select their finalized price.

Move Anywhere

*

You Set The Price

This design must be created first on the iPhone, since that's where the majority of our clients will be booking services. I like how ChatGPT sketched it out, but you would need to do the rest. For the picture at the bottom, I want 2 all brown animated stick figure-like characters looking at each other, holding a box. That might be something that I change, but I want to see how it looks. I also like the ChatGPT all black with the brown hints.

Pick Up & Drop Off

This will be a basic direction function that will compute the total mileage required for this move. No different than putting directions on maps on your phone. On the backend side, I'm also using this information for pricing as well. Not just for basic info. Whatever the mileage is, I want it to be **multiplied** by \$2.50. I will talk about this later.

Select Size

There are 3 home sizes that we work with (Studio/1 bed room, 2 bedroom, 3 bedroom). Each has its own base rate, estimated hourly rate, and equipment fee. This will allow us to give our recommended price at the end.

Studio/ 1 bed= \$300 Base + \$40 Equipment +Gas

2 bed= \$500 Base + \$60 Equipment +Gas

3 bed= \$915 Base + \$85 Equipment +Gas

** Gas formula is the miles between locations **multiplied** by \$2.50.

I don't want these pricings showing in this section. It's a hidden backend pricing formula that allows us to calculate our recommended price while they are selecting their move details.

Set Budget

This allows the customer to set their total budget pricing for how much they would like to spend on their move. For the slider, it should default to \$400 for studio/1 bed. \$600 for 2-bed. \$900 for 3-bed. Obviously, they can adjust it.

Pricing

I want this to be designed the way ChatGPT did, where everything will calculate and give the customer a given price for each tier of pricing. **“Their Pricing”** is their budgeted number with an additional add for gas and equipment.”

Premium” is the total of the pricing that I gave you from before. This is my recommended pricing for the move. **“Save”** pricing is when they only request labor, not trucks or any equipment. The formula is the premium base price **multiplied** by 0.85.

I want it to look more like the picture I drew with the uber/professional moving feel, but this is the core of what I want done. I’m not sure if the functions are accurate or calculate properly, but this was just to give you a baseline as to what I’m looking for.
